## Introduction to Partial Differential Equations

Homework 5

due March 21, 2013

1. Finish the proof of the mean value formula for the heat equation by showing that

$$\iint_{E(0,0;1)} \frac{|y|^2}{s^2} \, dy \, ds = 4 \,,$$

where

$$E(x,t;r) = \{(y,s) \colon \Phi(x-y,t-s) \ge r^{-n}\}$$

denotes the heat ball "centered" at (x, t).

*Hint:* Use polar coordinates in space, and an appropriate change of variables in time. The remaining one-dimensional integral is MATHEMATICA-integrable. You can also use that

$$\int_0^\infty t^{\lambda+1} e^{-\lambda t} dt = \frac{\Gamma(\lambda+2)}{\lambda^{2+\lambda}},$$
$$\Gamma(x+1) = x \,\Gamma(x),$$
$$\alpha(n) = \frac{\pi^{n/2}}{\Gamma(\frac{n}{2}+1)}.$$
