

# Elements of Calculus

## Homework 5 (covering Weeks 9 and 10)

Due on April 23, 2025, before the tutorial! Please submit on moodle.

### Problem 1 [2 points]

Consider the function  $f(x, y) = e^{-x}y^3$ , and the point  $\vec{a} = (1, 1)$ . At  $\vec{a}$ , in which direction does  $f$  increase the most? (If you like, visualize the function, e.g., with [geogebra.org/3d](http://geogebra.org/3d), and check that your answer makes sense.)

### Problem 2 [6 points]

We consider the function

$$f(x, y) = \begin{cases} \frac{xy^2}{x^2+y^2} & \text{for } (x, y) \neq (0, 0) \\ 0 & \text{for } (x, y) = (0, 0). \end{cases}$$

- (a) Convince yourself that  $f$  is continuous at  $(0, 0)$ . (Choose a sequence  $(x_n, y_n)$  that converges to  $(0, 0)$  and show that  $f(x_n, y_n)$  converges to 0.)
- (b) Compute the partial derivatives for  $(x, y) \neq (0, 0)$ . Then, using the definition of partial derivatives, compute  $(\partial_x f)(0, 0)$  and  $(\partial_y f)(0, 0)$ .
- (c) Show that  $f$  is not differentiable at  $(0, 0)$  according to the definition of differentiability from class.

### Problem 3 [2 points]

Let  $h : [0, \infty) \times [0, 2\pi) \times [0, \pi] \rightarrow \mathbb{R}^3$  be defined as

$$h(r, \varphi, \theta) := (r \cos \varphi \sin \theta, r \sin \varphi \sin \theta, r \cos \theta).$$

This is the change from spherical to Cartesian coordinates. Compute the Jacobian matrix of  $h$  and its determinant.

### Problem 4 [5 points]

In class, we discussed the Leibniz rule for computing the derivative of  $\int_a^b f(x, t)dt$ . Generalize this rule to the case when the boundaries also depend on  $x$ , i.e., find the corresponding rule to compute the derivative of

$$I(x) = \int_{u(x)}^{v(x)} f(x, t)dt.$$

Apply the new rule to compute the derivative of

$$G(x) = \int_x^{x^2} \frac{\sin(xt)}{t} dt.$$

**Problem 5 [3 points]**

Show that the function

$$u : \mathbb{R}^2 \setminus \{(0, 0)\} \rightarrow \mathbb{R}, \quad x \mapsto \ln \|x\|$$

solves the Laplace equation

$$\left( \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \right) u(x, y) = 0.$$

(Here,  $\|x\| = \sqrt{x^2 + y^2}$  is the usual 2-norm.)

**Problem 6 [2 points]**

Consider the function  $f : \mathbb{R}^2 \rightarrow \mathbb{R}$  given by  $f(x, y) = e^{-y^2} - x^2(y + 1)$ . Write down the Taylor expansion to second order.
